

Newsnight 24 January 2005(BBC 2)– Cloze Exercise

Susan Watts: Today's report (Recommendations of the International Climate Change Taskforce, Jan 25, 2005) calls for the world's industrialized countries to take a lead in putting its **1.** into effect. It wants agricultural **2.** switched from food crops to cleaner bio **3.** A tough target of a quarter of electricity generated from **4.** are 2025. Plans to prevent **5.** average temperatures rising a dangerous 2 degrees above the pre-industrial level and compulsory schemes for **6.** The European union started its own carbon trading scheme this month but it went ahead without the UK. This is because we asked to admit more carbon **7.** Now there is the threat of **8.** and the possibility of the farcical situation where we end up suing the EU for doing the right thing by (?) the world's climate. And it's not just in Europe that Tony Blair has disappointed. America, too, remains out of reach. But there is still time. [...]

Adair Turner: The key end point that we'll have to aim for is a roughly equal for all of us to **9.** CO 2. And quite frankly that means that Chinese people on average – at the end of this game – will probably emit a bit more than they do at the moment and we'll have to emit much less. But China will – in order to hit even that target, which is some increase, but not a lot of increase have to start planning what it does to its **10.** now. But actually there are some advantages in doing it at an early stage of **11.** because you can plan to get economic **12.** plant in place to begin with rather than **13.** what you've got to ... what you've built, which is inefficient to start with.

Fill in: 1. fuels 2. industrialization 3. average 4. carbon trading 5. dioxide 6. economy 7. emit 8. environmentally efficient 9. legal action 10. recommendations 11. renewable sources 12. retrofitting 13. subsidies
